It currently consists of 11 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP gatabases can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           on Nov 16, 2001 this sequence version replaced gi:16444706. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RP11-502H18 It may be shorter because we sequence overlapping sections only once, except for a short overlap.
The true left end of clone RP11-502H18 is at 1 in this sequence. The true left end of clone RP5-1180Cl0 is at 155124 in this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping

Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library

                                                                                                                               toxin subunit A (IT-A). This protein is used in a method resulting in a mutant LT-A protein which has the wild type Ala residue at position 72 changed to an Arg residue resulting in a toxin which retains its immunogenicity but is detoxified. Detoxification is defined in the specification as a reduction in toxicity relative to wild-type toxin, such that any residual toxicity is sufficiently low to allow use as an effective immunogenic composition in humans without significant side effects. The protein can be combined with an acceptable carrier in immunogenic compositions, optionally comprising an adjuvant and/or a second immunogenic antigen. Such compositions can be administered to prevent/treat disease in a subject e.g. traveller's diarrhoea in humans.
                                                                                  Sequence
                                                                                                                                                                                                                                       This sequence represents a fragment of an Escherichia coli heat labile toxin subunit A (LT-A). This protein is used in a method resulting in a
                                                                                                                                                                                                                                                                       Disclosure; Page -; 67pp; English.

A method is provided for the preparation of a protein having a subunit structure of 1A5B in which the above DNA is connected a vector expressible in Brevibacillus chosinensis and Brevibacillus chosinensis is transformed by said vector and said transformant is cultured. The protein can be used in the preparation of an adjuvant for vaccine. The present sequence represents the E. coli heat-labile toxin (LT) A subunit fragment, used for constructing a protein with the subunistructure of 1A5B.

The LTA gene the site directed mutant SDMI (see AAN50206) is inactive. The inventors claim a vaccine prepn. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.

                AAN50205 is the gene sequence of the natural LTA gene. The LTA gene the site directed mutant SDM1 (see AAN50206) is inactive. The inventors claim a vaccine prepn. active against plg scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Heat-labile toxin; LT-A; adjuvant; anti-bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY96646 standard;

The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.
This is mutant S63K Escherichia coli heat-labile toxin (LT) A subunit (LT-A). The wild-type serine was replaced with lysine at residue 63 of
                                                                                                                                                                                          (BOYC-)

The polynucleotide further comprises a nucleic acid sequence encoding LTB subunit (LT-B) or a CTB subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce adible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accommodate the creation of a Nool restriction site around the initiator methionine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              also

Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is mutant R192G Escherichia coli heat-labile toxin (LT) A subunit (LT-A). The wild-type arginine was replaced with glycine at residue 192 of the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomodate the creation of a NcoI restriction site around the initiator methionine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transformation of plant cells, useful in immunogenic compositions to elicit immune responses in animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Plant-optimized E.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 3; Page -; 103pp; English.
                                                                                                                                                                                                                                         Misc-difference

CC This is Escherichia coli heat-labile toxin (LT) A subunit (LT-A) double CC mutant $63K+R192G. The wild-type serine was replaced with lysine at cresidue 63 and wild-type arginine was replaced with glycine at codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomodate the creation of a NcoI restriction site around the initiator CC methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide cor a mutant vibrio cholerae cholera toxin (CT) A subunit (CT-A) cor CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotides compared to the comparises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible corphylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.

CC Note: This sequence does not appear in the specification. It was constructed from the wild type LT-A shown in AAY96646 which is given to the constructed from the wild type LT-A shown in AAY96646 which is given to the constructed from the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chosinensis is transformed by said vector and said transformant is cultured. The protein can be used in the preparation of an adjuvant for vaccine. The present sequence represents the E. coli mutant heat-labile
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      deleted from the A subunit gene and the B subunit gene and they are combined tandemly in the order of (B subunit gene)-(SD sequence gene)-(A subunit gene). A method is provided for the preparation of a protein having a subunit structure of 1A5B in which the above DNA is connected to a vector expressible in Brevibacillus chosinensis and Brevibacillus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a gene encoding a protein having a structure of 1A5B in which the DNA sequence encoding each si
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N-PSDB; ABL40640

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   deleted from the A subunit gene and the B subunit gene and they are combined tandemly in the order of (B subunit gene) (SD sequence gene). (A subunit gene). A method is provided for the preparation of a protein having a subunit structure of 1A5B in which the above DNA is connected to a vector expressible in Brevibacillus chosinensis and Brevibacillus chosinensis and Brevibacillus chosinensis is transformed by said vector and said transformant is cultured. The protein can be used in the preparation of an adjuvant for vaccine. The present sequence represents the E. coli heat-labile toxin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           type LT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks NAD-binding. Deletion of Glu residues at positions 110 and 112 in LTG61110/112 eliminate the enzymatic activity of LT. The Al subunit of wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that regulates cAMP levels. The resulting increase in cAMP is the cause of diarrhoea in humans and animals e.g. pigs. The mucosal immunogenicities of mutant heat-labile endotoxins LTS63Y and LTdell10/112 were tested. Groups of mice were immunised with LTS63Y or LTdell10/112. The control groups received phosphate buffered saline (PBS) alone. The serum and faecal antibody titres to LT were determined. The results showed that mice immunised with LTS63Y or LTdell10/112 contained high and compared with those immunised with wild-type LT. The LT mutants are useful as a vaccine for preventing and treating diarrhoea and as an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 6; Page 42-44; 48pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cc are two novel detoxified and immunologically active proteins (LT contents) derived by site-directed mutagenesis of the Al subunit of wild crype LT. The substitution of Ser to Tyr at position 63 in LT563y blocks (CR h)-binding, Deletion of Glu residues at positions 110 and 112 in CR LTdel110/112 eliminate the enzymatic activity of LT. The Al subunit of wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that regulates cAMP levels. The resulting increase in cAMP is the cause of CR diarrhoea in humans and animals e.g. pigs. The mucosal immunogenicities (CR of mutant heat-labile endotoxins LT563y and LTdel110/112 were tested. CR oroups of mice were immunised with LT563y or LTdel110/112. The control CR groups received phosphate buffered saline (PBS) alone. The serum and CR faecal antibody titres to LT were determined. The results showed that CR mice immunised with LT563y or LTdel110/112 contained high and CR comparable level of anti-LT antibodies in sera and faecal extracts compared with those immunised with wild-type LT. The LT mutants are useful as a vaccine for preventing and treating diarrhoea and as an antibody credition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                       enterotoxigenic bacteria; vaccine; immunogenic protomer A; site-directed mutagenesis; reduced

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigence E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 3; Fig 2 and Page 46; 60pp; English.

Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutain is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates to immunogenic, detoxified LT-A proteins and theair use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino

                                                                        The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamotto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic detoxified mutant cholera toxin and heat labile toxin - useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       enterotoxigenic bacteria; vaccine; immunogenic protomer A; site-directed mutagenesis; reduced

                                                         protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                   The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamannoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to

                                                                                                                                                                                                                                                                                                                                                            The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text.                                                                                                                                                                                                                                                                                                             The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates to immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
enterotoxigenic bacteria; vaccine; immu
protomer A; site-directed mutagenesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Location/Qualifiers Misc-difference 110

                                                                                                                                                                                                                                                                                                                                                                                   The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J. Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutatin is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 3; Fig 2 and Page 46; 60pp; English.

                                                                                                                                                                                                                                                enterotoxigenic bacteria; vaccine; immunogenic protomer A; site-directed mutagenesis; reduced ADP-ribosyltransferase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the sequence of the A subunit of the heat labile toxin (LT-A) of a Strain of E.coli known to affect humans. The sequence was published by Yamamoto et al, J.Biol. Chem., 259, 5037-5044.

Mutations at selected positions within this sequence have been found to reduce toxicity (see AAR38730-R38732 and AR84016-R44025). The invention relates to such immunogenic detoxified proteins and their use in vaccines to protect against enterotoxigenic E.coli.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al, J.Biol. Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed muttagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic detoxified mutant cholera toxin and heat labile toxin useful as vaccines against infection by Vibrio cholerae and enterotoxin producing Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 3;

Chem., 259, 5037-5044 - see AAQ42768) was subjected to site-directed mutagenesis. Certain mutations were found to reduce toxicity (see AAR38730-32 and AAR44016-R44025). The invention relates immunogenic, detoxified LT-A proteins and their use in vaccines to protect against enterotoxigenic E.coli. The amino acid sequence of this preferred detoxified mutein is not printed in the sequence and the description given in the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
The wild-type sequence coding for the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans (Yamamoto et al., J.Biol.                                                                                                                          This sequence corresponds to the amino acid sequence of the A subunit of the E. coli heat labile toxin, an example of a bacterial ADP-ribosylating toxin. A mutant detoxified form of this protein is used in a parenteral adjuvant composition, which comprises the detoxified protein, at least one selected antigen and optionally a pharmaceutically acceptable (optionally topical) vehicle. The adjuvant composition can be administered parenterally in conjunction with at least one antigen in methods to immunise vertebrate subjects. The adjuvant has the ability to enhance the humoral and cell mediated immune responses elicited by the antigen (e.g. by making the antigen more strongly immunogenic or necessitating fewer/lower antigen doses). It can be administered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A subunit; heat labile toxin; ADP-ribosylation; mutant; detoxification; parenteral adjuvant; antigen; immunisation; humoral response; cell-mediated immune response; virus; bacterium; parasite; fungus; tumour; allergen; pathogen; AIDS; autoimmune disease; cancer; antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                specification but has been assembled from the full-length wild-type sequence and the description given in the text. (N.B. Amino acid numbering is based on the cholera toxin A subunit sequence).
                       prior/subsequent to the antigen, and is preferably administered within a short space of time to the same site; it can also be administered in isolation from antigens as a boost following systemic or mucosal antigen administration. Most preferably, the adjuvant is co-administered with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detoxified mutants of bacterial ADP-ribosylating toxins as parenteral adjuvants - useful to enhance humoral and cell-mediated immune responses in vertebrates when administered with selected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19-MAR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptides which exhibit anti-retroviral cactivity. The peptides of the invention (AAU1259-AAU1409) comprise CD P178-like and DP107-like peptides. The DP178 peptide corresponds CC to amino acids 639-673 of the transmembrane protein gp41 from human CC immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide CC corresponds to amino acids 588-595 of gp41 from HIV-1LAI. The invention CC also relates to a method of identifying compounds that inhibit the CC formation of or disrupts a DP107/DP178 complex. The method comprises CC detecting the formation of a DP107/DP178 complex, both in the presence CC assence of a test compound, in a reaction mixture containing DP107 CC and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit CC antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

No. is the number of results predicted by chance to have a
ore greater than or equal to the score of the result being printed,
i is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seq length: 0 seq length: 2000000000

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score
